

Package ‘statnet.common’

May 24, 2023

Version 4.9.0

Date 2023-05-24

Title Common R Scripts and Utilities Used by the Statnet Project Software

Description Non-statistical utilities used by the software developed by the Statnet Project. They may also be of use to others.

Depends R (>= 3.5)

Imports utils, methods, coda, parallel, tools

BugReports <https://github.com/statnet/statnet.common/issues>

all_identical	<i>Test if all items in a vector or a list are identical.</i>
---------------	---

Description

Test if all items in a vector or a list are identical.

Usage

```
all_identical(x)
```

Arguments

x a vector or a list

Value

TRUE if all elements of x are identical to each other.

See Also

[identical](#)

Examples

```
stopifnot(!all_identical(1:3))  
  
stopifnot(all_identical(list("a", "a", "a")))
```

as.control.list	<i>Convert to a control list.</i>
-----------------	-----------------------------------

Description

Convert to a control list.

Usage

```
as.control.list(x, ...)  
  
## S3 method for class 'control.list'  
as.control.list(x, ...)  
  
## S3 method for class 'list'  
as.control.list(x, FUN = NULL, unflat = TRUE, ...)
```

Arguments

x	An object, usually a <code>list</code> , to be converted to a control list.
...	Additional arguments to methods.
FUN	Either a <code>control.*()</code> function or its name or suffix (to which "control." will be prepended); defaults to taking the nearest (in the call traceback) function that does not begin with "as.control.list", and prepending "control." to it. (This is typically the function that called <code>as.control.list()</code> in the first place.)
unflat	Logical, indicating whether an attempt should be made to detect whether some of the arguments are appropriate for a lower-level control function and pass them down.

Value

a `control.list` object.

Methods (by class)

- `as.control.list(control.list)`: Idempotent method for control lists.
- `as.control.list(list)`: The method for plain lists, which runs them through FUN.

Examples

```
myfun <- function(..., control=control.myfun()){
  as.control.list(control)
}
control.myfun <- function(a=1, b=a+1){
  list(a=a,b=b)
}

myfun()
myfun(control = list(a=2))
myfun2 <- function(..., control=control.myfun2()){
  as.control.list(control)
}
control.myfun2 <- function(c=3, d=c+2, myfun=control.myfun()){
  list(c=c,d=d,myfun=myfun)
}

myfun2()
# Argument to control.myfun() (i.e., a) gets passed to it, and a
# warning is issued for unused argument e.
myfun2(control = list(c=3, a=2, e=3))
```

attr	<i>A wrapper for base::attr which defaults to exact matching.</i>
------	---

Description

A wrapper for base::attr which defaults to exact matching.

Usage

```
attr(x, which, exact = TRUE)
```

Arguments

x, which, exact as in base::attr, but with exact defaulting to TRUE in this implementation

Value

as in base::attr

Examples

```
x <- list()
attr(x, "name") <- 10

base::attr(x, "n")

stopifnot(is.null(attr(x, "n")))

base::attr(x, "n", exact = TRUE)
```

check.control.class	<i>Ensure that the class of the control list is one of those that can be used by the calling function</i>
---------------------	---

Description

This function converts an ordinary list into a control list (if needed) and checks that the control list passed is appropriate for the function to be controlled.

Usage

```
check.control.class(
  OKnames = as.character(ult(sys.calls(), 2)[[1L]]),
  myname = as.character(ult(sys.calls(), 2)[[1L]]),
  control = get("control", pos = parent.frame())
)
```

Arguments

OKnames	List of control function names which are acceptable.
myname	Name of the calling function (used in the error message).
control	The control list or a list to be converted to a control list using <code>control.myname()</code> . Defaults to the <code>control</code> variable in the calling function. See Details for detailed behavior.

Details

`check.control.class()` performs the check by looking up the class of the `control` argument (defaulting to the `control` variable in the calling function) and checking if it matches a list of acceptable given by `OKnames`.

Before performing any checks, the `control` argument (including the default) will be converted to a control list by calling `as.control.list()` on it with the first element of `OKnames` to construct the control function.

If `control` is missing, it will be assumed that the user wants to modify it in place, and a variable with that name in the parent environment will be overwritten.

Value

A valid control list for the function in which it is to be used. If `control` argument is missing, it will also overwrite the variable `control` in the calling environment with it.

Note

In earlier versions, `OKnames` and `myname` were autodetected. This capability has been deprecated and results in a warning issued once per session. They now need to be set explicitly.

See Also

`set.control.class()`, `print.control.list()`, `as.control.list()`

compress_rows

A generic function to compress a row-weighted table

Description

Compress a matrix or a data frame with duplicated rows, updating row weights to reflect frequencies, or reverse the process, reconstructing a matrix like the one compressed (subject to permutation of rows and weights not adding up to an integer).

Usage

`compress_rows(x, ...)`

`decompress_rows(x, ...)`

Arguments

x a weighted matrix or data frame.
 ... extra arguments for methods.

Value

For compress_rows A weighted matrix or data frame of the same type with duplicated rows removed and weights updated appropriately.

```
compress_rows.data.frame
      "Compress" a data frame.
```

Description

compress_rows.data.frame "compresses" a data frame, returning unique rows and a tally of the number of times each row is repeated, as well as a permutation vector that can reconstruct the original data frame. decompress_rows.compressed_rows_df reconstructs the original data frame.

Usage

```
## S3 method for class 'data.frame'
compress_rows(x, ...)

## S3 method for class 'compressed_rows_df'
decompress_rows(x, ...)
```

Arguments

x For compress_rows.data.frame a [data.frame](#) to be compressed. For decompress_rows.compressed_rows_df a [list](#) as returned by compress_rows.data.frame.
 ... Additional arguments, currently unused.

Value

For compress_rows.data.frame, a [list](#) with three elements:

rows	Unique rows of x
frequencies	A vector of the same length as the number of rows, giving the number of times the corresponding row is repeated
ordering	A vector such that if c is the compressed data frame, c\$rows[c\$ordering, , drop=FALSE] equals the original data frame, except for row names
rownames	Row names of x

For decompress_rows.compressed_rows_df, the original data frame.

See Also

[data.frame](#)

Examples

```
(x <- data.frame(V1=sample.int(3,30,replace=TRUE),
                V2=sample.int(2,30,replace=TRUE),
                V3=sample.int(4,30,replace=TRUE)))
```

```
(c <- compress_rows(x))
```

```
stopifnot(all(decompress_rows(c)==x))
```

control.list.accessor *Named element accessor for ergm control lists*

Description

Utility method that overrides the standard '\$' list accessor to disable partial matching for ergm control.list objects

Usage

```
## S3 method for class 'control.list'
object$name
```

Arguments

object	list-coerceable object with elements to be searched
name	literal character name of list element to search for and return

Details

Executes [getElement](#) instead of \$ so that element names must match exactly to be returned and partially matching names will not return the wrong object.

Value

Returns the named list element exactly matching name, or NULL if no matching elements found

Author(s)

Pavel N. Krivitsky

See Also

see [getElement](#)

control.remap	<i>Overwrite control parameters of one configuration with another.</i>
---------------	--

Description

Given a `control.list`, and two prefixes, `from` and `to`, overwrite the elements starting with `to` with the corresponding elements starting with `from`.

Usage

```
control.remap(control, from, to)
```

Arguments

<code>control</code>	An object of class <code>control.list</code> .
<code>from</code>	Prefix of the source of control parameters.
<code>to</code>	Prefix of the destination of control parameters.

Value

An `control.list` object.

Author(s)

Pavel N. Krivitsky

See Also

[print.control.list](#)

Examples

```
(l <- set.control.class("test", list(a.x=1, a.y=2)))  
control.remap(l, "a", "b")
```

default_options *Set [options\(\)](#) according to a named list, skipping those already set.*

Description

This function can be useful for setting default options, which do not override options set elsewhere.

Usage

```
default_options(...)
```

Arguments

... see [options\(\)](#): either a list of name=value pairs or a single unnamed argument giving a named list of options to set.

Value

The return value is same as that of [options\(\)](#) (omitting options already set).

Examples

```
options(onesetting=1)

default_options(onesetting=2, anothersetting=3)
stopifnot(getOption("onesetting")==1) # Still 1.
stopifnot(getOption("anothersetting")==3)

default_options(list(yetanothersetting=5, anothersetting=4))
stopifnot(getOption("anothersetting")==3) # Still 3.
stopifnot(getOption("yetanothersetting")==5)
```

deInf *Truncate values of high magnitude in a vector.*

Description

Truncate values of high magnitude in a vector.

Usage

```
deInf(x, replace = 1/.Machine$double.eps)
```

Arguments

x a numeric or integer vector.
replace a number or a string "maxint" or "intmax".

Value

Returns `x` with elements whose magnitudes exceed `replace` replaced by `replace` (or its negation). If `replace` is "maxint" or "intmax", `.Machine$integer.max` is used instead.

NA and NAN values are preserved.

deprecation-utilities *Utilities to help with deprecating functions.*

Description

`.Deprecate_once` calls `.Deprecated()`, passing all its arguments through, but only the first time it's called.

`.Deprecate_method` calls `.Deprecated()`, but only if a method has been called by name, i.e., `METHOD.CLASS`. Like `.Deprecate_once` it only issues a warning the first time.

Usage

```
.Deprecate_once(...)
```

```
.Deprecate_method(generic, class)
```

Arguments

`...` arguments passed to `.Deprecated()`.

`generic, class` strings giving the generic function name and class name of the function to be deprecated.

Examples

```
## Not run:
options(warn=1) # Print warning immediately after the call.
f <- function(){
  .Deprecate_once("new_f")
}
f() # Deprecation warning
f() # No deprecation warning

## End(Not run)
## Not run:
options(warn=1) # Print warning immediately after the call.
summary.packageDescription <- function(object, ...){
  .Deprecate_method("summary", "packageDescription")
  invisible(object)
}

summary(packageDescription("statnet.common")) # No warning.
summary.packageDescription(packageDescription("statnet.common")) # Warning.
```

```
summary.packageDescription(packageDescription("statnet.common")) # No warning.
## End(Not run)
```

```
despace          A one-line function to strip whitespace from its argument.
```

Description

A one-line function to strip whitespace from its argument.

Usage

```
despace(s)
```

Arguments

`s` a character vector.

Examples

```
stopifnot(despace("\n \t ")=="")
```

```
diff.control.list Identify and the differences between two control lists.
```

Description

Identify and the differences between two control lists.

Usage

```
## S3 method for class 'control.list'
diff(x, y = eval(call(class(x)[[1L]])), ignore.environment = TRUE, ...)
```

```
## S3 method for class 'diff.control.list'
print(x, ..., indent = "")
```

Arguments

`x` a `control.list`

`y` a reference `control.list`; defaults to the default settings for `x`.

`ignore.environment` whether environment for environment-bearing parameters (such as formulas and functions) should be considered when comparing.

`...` Additional arguments to methods.

`indent` an argument for recursive calls, to facilitate indentation of nested lists.

Value

An object of class `diff.control.list`: a named list with an element for each non-identical setting. The element is either itself a `diff.control.list` (if the setting is a control list) or a named list with elements `x` and `y`, containing `x`'s and `y`'s values of the parameter for that setting.

Methods (by generic)

- `print(diff.control.list)`: A print method.

<code>empty_env</code>	<i>Replace an object's environment with a simple, static environment.</i>
------------------------	---

Description

Replace an object's environment with a simple, static environment.

Usage

```
empty_env(object)
```

```
base_env(object)
```

Arguments

`object` An object with the `environment()`<- method.

Value

An object of the same type as `object`, with updated environment.

Examples

```
f <- y~x
environment(f) # GlobalEnv

environment(empty_env(f)) # EmptyEnv

environment(base_env(f)) # base package environment
```

ERRVL	<i>Return the first argument passed (out of any number) that is not a try-error (result of <code>try</code> encountering an error).</i>
-------	---

Description

This function is inspired by `NVL`, and simply returns the first argument that is not a try-error, raising an error if all arguments are try-errors.

Usage

```
ERRVL(...)
```

Arguments

... Expressions to be tested; usually outputs of `try`.

Value

The first argument that is not a try-error. Stops with an error if all are.

Note

This function uses lazy evaluation, so, for example `ERRVL(1, stop("Error!"))` will never evaluate the `stop` call and will not produce an error, whereas `ERRVL(try(solve(0)), stop("Error!"))` would.

In addition, all expressions after the first may contain a `.`, which is substituted with the try-error object returned by the previous expression.

See Also

`try`, `inherits`

Examples

```
print(ERRVL(1,2,3)) # 1
print(ERRVL(try(solve(0)),2,3)) # 2
print(ERRVL(1, stop("Error!"))) # No error

## Not run:
# Error:
print(ERRVL(try(solve(0), silent=TRUE),
            stop("Error!")))

# Error with an elaborate message:
print(ERRVL(try(solve(0), silent=TRUE),
            stop("Stopped with an error: ", .)))

## End(Not run)
```

fixed.pval	<i>Format a p-value in fixed notation.</i>
------------	--

Description

This is a thin wrapper around `format.pval()` that guarantees fixed (not scientific) notation, links (by default) the `eps` argument to the `digits` argument and vice versa, and sets `nsmall` to equal `digits`.

Usage

```
fixed.pval(  
  pv,  
  digits = max(1, getOption("digits") - 2),  
  eps = 10^-digits,  
  na.form = "NA",  
  ...  
)
```

Arguments

`pv`, `digits`, `eps`, `na.form`, ...
see `format.pval()`.

Value

A character vector.

Examples

```
pvs <- 10^((0:-12)/2)  
  
# Jointly:  
fpf <- fixed.pval(pvs, digits = 3)  
fpf  
format.pval(pvs, digits = 3) # compare  
  
# Individually:  
fpf <- sapply(pvs, fixed.pval, digits = 3)  
fpf  
sapply(pvs, format.pval, digits = 3) # compare  
  
# Control eps:  
fpf <- sapply(pvs, fixed.pval, eps = 1e-3)  
fpf
```

forkTimeout	<i>Evaluate an R expression with a hard time limit by forking a process</i>
-------------	---

Description

This function uses `parallel::mcpipeline()`, so the time limit is not enforced on Windows. However, unlike functions using `setTimeLimit()`, the time limit is enforced even on native code.

Usage

```
forkTimeout(
  expr,
  timeout,
  unsupported = c("warning", "error", "message", "silent"),
  onTimeout = NULL
)
```

Arguments

expr	expression to be evaluated.
timeout	number of seconds to wait for the expression to evaluate.
unsupported	a character vector of length 1 specifying how to handle a platform that does not support <code>parallel::mcpipeline()</code> , "warning" or "message" Issue a warning or a message, respectively, then evaluate the expression without the time limit enforced. "error" Stop with an error. "silent" Evaluate the expression without the time limit enforced, without any notice. Partial matching is used.
onTimeout	Value to be returned on time-out.

Value

Result of evaluating `expr` if completed, `onTimeout` otherwise.

Note

`onTimeout` can itself be an expression, so it is, for example, possible to stop with an error by passing `onTimeout=stop()`.

Note that this function is not completely transparent: side-effects may behave in unexpected ways. In particular, RNG state will not be updated.

Examples

```
forkTimeout({Sys.sleep(1); TRUE}, 2) # TRUE
forkTimeout({Sys.sleep(1); TRUE}, 0.5) # NULL (except on Windows)
```

formula.utilities *Functions for Querying, Validating and Extracting from Formulas*

Description

A suite of utilities for handling model formulas of the style used in Statnet packages.

Usage

```

append_rhs.formula(
  object = NULL,
  newterms,
  keep.onesided = FALSE,
  env = if (is.null(object)) NULL else environment(object)
)

append_rhs.formula(object, newterms, keep.onesided = FALSE)

filter_rhs.formula(object, f, ...)

nonsimp_update.formula(object, new, ..., from.new = FALSE)

nonsimp.update.formula(object, new, ..., from.new = FALSE)

term.list.formula(rhs, sign = +1)

list_summands.call(object)

list_rhs.formula(object)

eval_lhs.formula(object)

```

Arguments

object	formula object to be updated or evaluated
newterms	a <code>term_list</code> object, or any list of terms (names or calls) to append to the formula, or a formula whose RHS terms will be used; its "sign" attribute vector can give the sign of each term (+1 or -1), and its "env" attribute vector will be used to set its environment, with the first available being used and subsequent ones producing a warning.
keep.onesided	if the initial formula is one-sided, keep it whether to keep it one-sided or whether to make the initial formula the new LHS
env	an environment for the new formula, if object is NULL
f	a function whose first argument is the term and whose additional arguments are forwarded from ... that returns either TRUE or FALSE, for whether that term should be kept.

...	Additional arguments. Currently unused.
new	new formula to be used in updating
from.new	logical or character vector of variable names. controls how environment of formula gets updated.
rhs, sign	Arguments to the deprecated term.list.formula.

Value

append_rhs.formula each return an updated formula object; if object is NULL (the default), a one-sided formula containing only the terms in newterms will be returned.

nonsimp_update.formula each return an updated formula object

list_summands.call returns an object of type `term_list`; its "env" attribute is set to a list of NULLs, however.

list_rhs.formula returns an object of type `term_list`.

eval_lhs.formula an object of whatever type the LHS evaluates to.

Functions

- `append_rhs.formula()`: `append_rhs.formula` appends a list of terms to the RHS of a formula. If the formula is one-sided, the RHS becomes the LHS, if `keep.onesided==FALSE` (the default).
- `append_rhs.formula()`: `append_rhs.formula` has been renamed to `append_rhs.formula`.
- `filter_rhs.formula()`: `filter_rhs.formula` filters through the terms in the RHS of a formula, returning a formula without the terms for which function `f(term, ...)` is FALSE. Terms inside another term (e.g., parentheses or an operator other than + or -) will be unaffected.
- `nonsimp_update.formula()`: `nonsimp_update.formula` is a reimplement of `update.formula` that does not simplify. Note that the resulting formula's environment is set as follows. If `from.new==FALSE`, it is set to that of object. Otherwise, a new sub-environment of object, containing, in addition, variables in new listed in from.new (if a character vector) or all of new (if TRUE).
- `nonsimp.update.formula()`: `nonsimp.update.formula` has been renamed to `nonsimp_update.formula`.
- `term.list.formula()`: `term.list.formula` is an older version of `list_rhs.formula` that required the RHS call, rather than the formula itself.
- `list_summands.call()`: `list_summands.call`, given an unevaluated call or expression containing the sum of one or more terms, returns an object of class `term_list` with the terms being summed, handling + and - operators and parentheses, and keeping track of whether a term has a plus or a minus sign.
- `list_rhs.formula()`: `list_rhs.formula` returns an object of type `term_list`, containing terms in a given formula, handling + and - operators and parentheses, and keeping track of whether a term has a plus or a minus sign.
- `eval_lhs.formula()`: `eval_lhs.formula` extracts the LHS of a formula, evaluates it in the formula's environment, and returns the result.

Examples

```

## append_rhs.formula

(f1 <- append_rhs.formula(y~x,list(as.name("z1"),as.name("z2"))))
(f2 <- append_rhs.formula(~y,list(as.name("z"))))
(f3 <- append_rhs.formula(~y+x,structure(list(as.name("z")),sign=-1)))
(f4 <- append_rhs.formula(~y,list(as.name("z")),TRUE))
(f5 <- append_rhs.formula(y~x,~z1-z2))
(f6 <- append_rhs.formula(NULL,list(as.name("z"))))
(f7 <- append_rhs.formula(NULL,structure(list(as.name("z")),sign=-1)))

fe <- ~z2+z3
environment(fe) <- new.env()
(f8 <- append_rhs.formula(NULL, fe)) # OK
(f9 <- append_rhs.formula(y~x, fe)) # Warning
(f10 <- append_rhs.formula(y~x, fe, env=NULL)) # No warning, environment from fe.
(f11 <- append_rhs.formula(fe, ~z1)) # Warning, environment from fe

## filter_rhs.formula
(f1 <- filter_rhs.formula(~a-b+c, `!=`, "a"))

                    structure(alist(b, NULL),
                              sign=c(-1,1), env=rep(list(globalenv()), 2), class="term_list")))
stopifnot(identical(list_rhs.formula(~+b-NULL),
                    structure(alist(b, NULL),
                              sign=c(1,-1), env=rep(list(globalenv()), 2), class="term_list")))
stopifnot(identical(list_rhs.formula(~+b-(NULL+c)),
                    structure(alist(b, NULL, c),
                              sign=c(1,-1,-1), env=rep(list(globalenv()), 3), class="term_list")))

## eval_lhs.formula

```

```
(result <- eval_lhs.formula((2+2)~1))  
stopifnot(identical(result,4))
```

handle.controls	<i>Handle standard control.*() function semantics.</i>
-----------------	--

Description

This function takes the arguments of its caller (whose name should be passed explicitly), plus any ... arguments and produces a control list based on the standard semantics of control.*() functions, including handling deprecated arguments, identifying undefined arguments, and handling arguments that should be passed through [match.arg\(\)](#).

Usage

```
handle.controls(myname, ...)
```

Arguments

myname	the name of the calling function.
...	the ... argument of the control function, if present.

Details

The function behaves based on the information it acquires from the calling function. Specifically,

- The values of formal arguments (except ..., if present) are taken from the environment of the calling function and stored in the list.
- If the calling function has a ... argument *and* defines an old.controls variable in its environment, then it remaps the names in ... to their new names based on old.controls. In addition, if the value is a list with two elements, action and message, the standard deprecation message will have message appended to it and then be called with action().
- If the calling function has a match.arg.pars in its environment, the arguments in that list are processed through [match.arg\(\)](#).

Value

a list with formal arguments of the calling function.

is.SPD	<i>Test if the object is a matrix that is symmetric and positive definite</i>
--------	---

Description

Test if the object is a matrix that is symmetric and positive definite

Usage

```
is.SPD(x, tol = .Machine$double.eps)
```

Arguments

x	the object to be tested.
tol	the tolerance for the reciprocal condition number.

locate_function	<i>Locate a function with a given name and return it and its environment.</i>
-----------------	---

Description

These functions first search the given environment, then search all loaded environments, including those where the function is not exported. If found, they return an unambiguous reference to the function.

Usage

```
locate_function(name, env = globalenv(), ...)
```

```
locate_prefixed_function(
  name,
  prefix,
  errname,
  env = globalenv(),
  ...,
  call. = FALSE
)
```

Arguments

name	a character string giving the function's name.
env	an environment where it should search first.
...	additional arguments to the warning and error warning messages. See Details .
prefix	a character string giving the prefix, so the searched-for function is <code>prefix.name</code> .

<code>errmsg</code>	a character string; if given, if the function is not found an error is raised, with <code>errmsg</code> prepended to the error message.
<code>call</code>	a logical, whether the call (<code>locate_prefixed_function</code>) should be a part of the error message; defaults to <code>FALSE</code> (which is different from <code>stop()</code> 's default).

Details

If the initial search fails, a search using `getAnywhere()` is attempted, with exported ("visible") functions with the specified name preferred over those that are not. When multiple equally qualified functions are available, a warning is printed and an arbitrary one is returned.

Because `getAnywhere()` can be slow, past searches are cached.

Value

If the function is found, an unevaluated call of the form `ENVNAME:::FUNNAME`, which can then be used to call the function even if it is unexported. If the environment does not have a name, or is `GlobalEnv`, only `FUNNAME` is returned. Otherwise, `NULL` is returned.

Functions

- `locate_function()`: a low-level function returning the reference to the function named `name`, or `NULL` if not found.
- `locate_prefixed_function()`: a helper function that searches for a function of the form `prefix.name` and produces an informative error message if not found.

Examples

```
# Locate a random function in base.
locate_function(".row_names_info")
```

logspace.utils

Utilities for performing calculations on logarithmic scale.

Description

A small suite of functions to compute sums, means, and weighted means on logarithmic scale, minimizing loss of precision.

Usage

```
log_sum_exp(logx, use_ldouble = FALSE)
```

```
log_mean_exp(logx, use_ldouble = FALSE)
```

```
lweighted.mean(x, logw)
```

```
lweighted.var(x, logw)
```

```
lweighted.cov(x, y, logw)
```

Arguments

logx	Numeric vector of $\log(x)$, the natural logarithms of the values to be summed or averaged.
use_ldouble	Whether to use long double precision in the calculation. If TRUE, 's C built-in logspace_sum() is used. If FALSE, the package's own implementation based on it is used, using double precision, which is (on most systems) several times faster, at the cost of precision.
x, y	Numeric vectors or matrices of x and y , the (raw) values to be summed, averaged, or whose variances and covariances are to be calculated.
logw	Numeric vector of $\log(w)$, the natural logarithms of the weights.

Value

The functions return the equivalents of the R expressions given below, but faster and with less loss of precision.

Functions

- `log_sum_exp()`: $\log(\text{sum}(\exp(\text{logx})))$
- `log_mean_exp()`: $\log(\text{mean}(\exp(\text{logx})))$
- `lweighted.mean()`: weighted mean of x : $\text{sum}(x \cdot \exp(\text{logw})) / \text{sum}(\exp(\text{logw}))$ for x scalar and $\text{colSums}(x \cdot \exp(\text{logw})) / \text{sum}(\exp(\text{logw}))$ for x matrix
- `lweighted.var()`: weighted variance of x : $\text{crossprod}(x - \text{lweighted.mean}(x, \text{logw}) \cdot \exp(\text{logw}/2)) / \text{sum}(\exp(\text{logw}))$
- `lweighted.cov()`: weighted covariance between x and y : $\text{crossprod}(x - \text{lweighted.mean}(x, \text{logw}) \cdot \exp(\text{logw}/2), y - \text{lweighted.mean}(y, \text{logw}) \cdot \exp(\text{logw}/2)) / \text{sum}(\exp(\text{logw}))$

Author(s)

Pavel N. Krivitsky

Examples

```
x <- rnorm(1000)
stopifnot(all.equal(log_sum_exp(x), log(sum(exp(x))), check.attributes=FALSE))
stopifnot(all.equal(log_mean_exp(x), log(mean(exp(x))), check.attributes=FALSE))

logw <- rnorm(1000)
stopifnot(all.equal(m <- sum(x*exp(logw))/sum(exp(logw)), lweighted.mean(x, logw)))
stopifnot(all.equal(sum((x-m)^2*exp(logw))/sum(exp(logw)),
                    lweighted.var(x, logw), check.attributes=FALSE))

x <- cbind(x, rnorm(1000))
stopifnot(all.equal(mx <- colSums(x*exp(logw))/sum(exp(logw)),
```

```

      lweighted.mean(x, logw), check.attributes=FALSE))
stopifnot(all.equal(crossprod(t(t(x)-mx)*exp(logw/2))/sum(exp(logw)),
      lweighted.var(x, logw), check.attributes=FALSE))

y <- cbind(x, rnorm(1000))
my <- colSums(y*exp(logw))/sum(exp(logw))
stopifnot(all.equal(crossprod(t(t(x)-mx)*exp(logw/2), t(t(y)-my)*exp(logw/2))/sum(exp(logw)),
      lweighted.cov(x, y, logw), check.attributes=FALSE))
stopifnot(all.equal(crossprod(t(t(y)-my)*exp(logw/2), t(t(x)-mx)*exp(logw/2))/sum(exp(logw)),
      lweighted.cov(y, x, logw), check.attributes=FALSE))

```

mcmc-utilities

Utility operations for `mcmc.list` objects

Description

`colMeans.mcmc.list` is a "method" for (non-generic) `colMeans` applicable to `mcmc.list` objects.

`sweep.mcmc.list` is a "method" for (non-generic) `sweep` applicable to `mcmc.list` objects.

`lapply.mcmc.list` is a "method" for (non-generic) `lapply` applicable to `mcmc.list` objects.

Usage

```
colMeans.mcmc.list(x, ...)
```

```
sweep.mcmc.list(x, STATS, FUN = "-", check.margin = TRUE, ...)
```

```
lapply.mcmc.list(X, FUN, ...)
```

Arguments

`x` a `mcmc.list` object.

`...` additional arguments to `colMeans` or `sweep`.

`STATS, FUN, check.margin`
See help for `sweep`.

`X` An `mcmc.list` object.

Value

`colMeans.mcmc` returns a vector with length equal to the number of mcmc chains in `x` with the mean value for each chain.

`sweep.mcmc.list` returns an appropriately modified version of `x`

`lapply.mcmc.list` returns an `mcmc.list` each of whose chains had been passed through `FUN`.

See Also[colMeans](#), [mcmc.list](#)[sweep](#)[lapply](#)**Examples**

```
data(line, package="coda")
summary(line) # coda
colMeans.mcmc.list(line) # "Method"
```

```
data(line, package="coda")
colMeans.mcmc.list(line)-1:3
colMeans.mcmc.list(sweep.mcmc.list(line, 1:3))
```

```
data(line, package="coda")
colMeans.mcmc.list(line)[c(2,3,1)]
colMeans.mcmc.list(lapply.mcmc.list(line, `[`, ,c(2,3,1)))
```

message_print	print objects to the message output.
---------------	--

Description

A thin wrapper around [print](#) that captures its output and prints it as a [message](#), usually to STDERR.

Usage

```
message_print(..., messageArgs = NULL)
```

Arguments

... arguments to [print](#).
messageArgs a list of arguments to be passed directly to [message](#).

Examples

```
cat(1:5)

print(1:5)
message_print(1:5) # Looks the same (though may be in a different color on some frontends).

suppressMessages(print(1:5)) # Still prints
suppressMessages(message_print(1:5)) # Silenced
```

NVL

*Convenience functions for handling [NULL](#) objects.***Description**

Convenience functions for handling [NULL](#) objects.

Usage

```
NVL(...)
```

```
NVL2(test, notnull, null = NULL)
```

```
NVL3(test, notnull, null = NULL)
```

```
EVL(...)
```

```
EVL2(test, notnull, null = NULL)
```

```
EVL3(test, notnull, null = NULL)
```

```
NVL(x) <- value
```

```
EVL(x) <- value
```

Arguments

<code>...</code> , <code>test</code>	expressions to be tested.
<code>notnull</code>	expression to be returned if <code>test</code> is not <code>NULL</code> .
<code>null</code>	expression to be returned if <code>test</code> is <code>NULL</code> .
<code>x</code>	an object to be overwritten if NULL .
<code>value</code>	new value for <code>x</code> .

Functions

- `NVL()`: Inspired by SQL function `NVL`, returns the first argument that is not `NULL`, or `NULL` if all arguments are `NULL`.
- `NVL2()`: Inspired by Oracle SQL function `NVL2`, returns the second argument if the first argument is not `NULL` and the third argument if the first argument is `NULL`. The third argument defaults to `NULL`, so `NVL2(a, b)` can serve as shorthand for `(if(!is.null(a)) b)`.
- `NVL3()`: Inspired by Oracle SQL `NVL2` function and `magi ttr %>%` operator, behaves as `NVL2` but `.s` in the second argument are substituted with the first argument.
- `EVL()`: As `NVL`, but for any objects of length 0 (*Empty*) rather than just `NULL`. Note that if no non-zero-length arguments are given, `NULL` is returned.
- `EVL2()`: As `NVL2`, but for any objects of length 0 (*Empty*) rather than just `NULL`.

- `EVL3()`: As `NVL3`, but for any objects of length 0 (*Empty*) rather than just `NULL`.
- `NVL(x) <- value`: Assigning to `NVL` overwrites its first argument if that argument is `NULL`. Note that it will *always* return the right-hand-side of the assignment (`value`), regardless of what `x` is.
- `EVL(x) <- value`: As assignment to `NVL`, but for any objects of length 0 (*Empty*) rather than just `NULL`.

Note

Whenever possible, these functions use lazy evaluation, so, for example `NVL(1, stop("Error!"))` will never evaluate the `stop` call and will not produce an error, whereas `NVL(NULL, stop("Error!"))` would.

See Also

[NULL](#), [is.null](#), [if](#)

Examples

```
a <- NULL

a # NULL
NVL(a,0) # 0

b <- 1

b # 1
NVL(b,0) # 1

# Here, object x does not exist, but since b is not NULL, x is
# never evaluated, so the statement finishes.
NVL(b,x) # 1

# Also,
NVL(NULL,1,0) # 1
NVL(NULL,0,1) # 0
NVL(NULL,NULL,0) # 0
NVL(NULL,NULL,NULL) # NULL

NVL2(a, "not null!", "null!") # "null!"
NVL2(b, "not null!", "null!") # "not null!"

NVL3(a, "not null!", "null!") # "null!"
NVL3(b, .+1, "null!") # 2

NVL(NULL*2, 1) # numeric(0) is not NULL
EVL(NULL*2, 1) # 1

NVL(a) <- 2
a # 2
```

```
NVL(b) <- 2
b # still 1
```

once

Evaluate a function once for a given input.

Description

This is a purrr-style adverb that checks if a given function has already been called with a given configuration of arguments and skips it if it has.

Usage

```
once(f, expire_after = Inf, max_entries = Inf)
```

Arguments

f	A function to modify.
expire_after	The number of seconds since it was added to the database before a particular configuration is "forgotten". This can be used to periodically remind the user without overwhelming them.
max_entries	The number of distinct configurations to remember. If not Inf, <i>earliest-inserted</i> configurations will be removed from the database when capacity is exceeded. (This exact behavior may change in the future.)

Details

Each modified function instance returned by `once()` maintains a database of previous argument configurations. They are not in any way compressed, so this database may grow over time. Thus, this wrapper should be used with caution if arguments are large objects. This may be replaced with hashing in the future. In the meantime, you may want to set the `max_entries` argument to be safe.

Different instances of a modified function do not share databases, even if the function is the same. This means that if you, say, modify a function within another function, the modified function will call `once` per call to the outer function. Modified functions defined at package level count as the same "instance", however. See example.

Note

Because the function needs to test whether a particular configuration of arguments have already been used, do not rely on lazy evaluation behaviour.

Examples

```

msg <- once(message)
msg("abc") # Prints.
msg("abc") # Silent.

msg <- once(message) # Starts over.
msg("abc") # Prints.

f <- function(){
  innermsg <- once(message)
  innermsg("efg") # Prints once per call to f().
  innermsg("efg") # Silent.
  msg("abcd") # Prints only the first time f() is called.
  msg("abcd") # Silent.
}
f() # Prints "efg" and "abcd".
f() # Prints only "efg".

msg3 <- once(message, max_entries=3)
msg3("a") # 1 remembered.
msg3("a") # Silent.
msg3("b") # 2 remembered.
msg3("a") # Silent.
msg3("c") # 3 remembered.
msg3("a") # Silent.
msg3("d") # "a" forgotten.
msg3("a") # Printed.

msg2s <- once(message, expire_after=2)
msg2s("abc") # Prints.
msg2s("abc") # Silent.
Sys.sleep(1)
msg2s("abc") # Silent after 1 sec.
Sys.sleep(1.1)
msg2s("abc") # Prints after 2.1 sec.

```

opttest

Optionally test code depending on environment variable.

Description

A convenience wrapper to run code based on whether an environment variable is defined.

Usage

```

opttest(
  expr,
  testname = NULL,

```

```

  testvar = "ENABLE_statnet_TESTS",
  yesvals = c("y", "yes", "t", "true", "1"),
  lowercase = TRUE
)

```

Arguments

<code>expr</code>	An expression to be evaluated only if <code>testvar</code> is set to a non-empty value.
<code>testname</code>	Optional name of the test. If given, and the test is skipped, will print a message to that end, including the name of the test, and instructions on how to enable it.
<code>testvar</code>	Environment variable name. If set to one of the <code>yesvals</code> , <code>expr</code> is run. Otherwise, an optional message is printed.
<code>yesvals</code>	A character vector of strings considered affirmative values for <code>testvar</code> .
<code>lowercase</code>	Whether to convert the value of <code>testvar</code> to lower case before comparing it to <code>yesvals</code> .

<code>order</code>	<i>Implement the <code>sort</code> and <code>order</code> methods for <code>data.frame</code> and <code>matrix</code>, sorting it in lexicographic order.</i>
--------------------	---

Description

These function return a data frame sorted in lexicographic order or a permutation that will rearrange it into lexicographic order: first by the first column, ties broken by the second, remaining ties by the third, etc..

Usage

```

order(..., na.last = TRUE, decreasing = FALSE)

## Default S3 method:
order(..., na.last = TRUE, decreasing = FALSE)

## S3 method for class 'data.frame'
order(..., na.last = TRUE, decreasing = FALSE)

## S3 method for class 'matrix'
order(..., na.last = TRUE, decreasing = FALSE)

## S3 method for class 'data.frame'
sort(x, decreasing = FALSE, ...)

```

Arguments

...	Ignored for sort. For order, first argument is the data frame to be ordered. (This is needed for compatibility with order .)
na.last	See order documentation.
decreasing	Whether to sort in decreasing order.
x	A data.frame to sort.

Value

For sort, a data frame, sorted lexicographically. For order, a permutation I (of a vector 1:nrow(x)) such that x[I, , drop=FALSE] equals x ordered lexicographically.

See Also

[data.frame](#), [sort](#), [order](#), [matrix](#)

Examples

```
data(iris)
head(iris)
head(order(iris))
head(sort(iris))
stopifnot(identical(sort(iris),iris[order(iris),]))
```

paste.and	<i>Concatenates the elements of a vector (optionally enclosing them in quotation marks or parentheses) adding appropriate punctuation and conjunctions.</i>
-----------	---

Description

A vector x becomes "x[1]", "x[1] and x[2]", or "x[1], x[2], and x[3]", depending on the length of x.

Usage

```
paste.and(x, oq = "", cq = "", con = "and")
```

Arguments

x	A vector.
oq	Opening quotation symbol. (Defaults to none.)
cq	Closing quotation symbol. (Defaults to none.)
con	Conjunction to be used if length(x)>1. (Defaults to "and".)

Value

A string with the output.

See Also

paste, cat

Examples

```
print(paste.and(c()))
print(paste.and(1))
print(paste.and(1:2))
print(paste.and(1:3))
print(paste.and(1:4, con='or'))
```

persistEval

Evaluate an expression, restarting on error

Description

A pair of functions paralleling `eval()` and `evalq()` that make multiple attempts at evaluating an expression, retrying on error up to a specified number of attempts, and optionally evaluating another expression before restarting.

Usage

```
persistEval(
  expr,
  retries = NVL(getOption("eval.retries"), 5),
  beforeRetry,
  envir = parent.frame(),
  enclos = if (is.list(envir) || is.pairlist(envir)) parent.frame() else baseenv(),
  verbose = FALSE
)
```

```
persistEvalQ(
  expr,
  retries = NVL(getOption("eval.retries"), 5),
  beforeRetry,
  envir = parent.frame(),
  enclos = if (is.list(envir) || is.pairlist(envir)) parent.frame() else baseenv(),
  verbose = FALSE
)
```

Arguments

expr	an expression to be retried; note the difference between <code>eval()</code> and <code>evalq()</code> .
retries	number of retries to make; defaults to "eval.retries" option, or 5.
beforeRetry	if given, an expression that will be evaluated before each retry if the initial attempt fails; it is evaluated in the same environment and with the same quoting semantics as expr, but its errors are not handled.
envir, enclos	see <code>eval()</code> .
verbose	Whether to output retries.

Value

Results of evaluating expr, including side-effects such as variable assignments, if successful in retries retries.

Note

If expr returns a "try-error" object (returned by `try()`), it will be treated as an error. This behavior may change in the future.

Examples

```
x <- 0
persistEvalQ({if((x<-x+1)<3) stop("x < 3") else x},
             beforeRetry = {cat("Will try incrementing...\n")})

x <- 0
e <- quote(if((x<-x+1)<3) stop("x < 3") else x)
persistEval(e,
            beforeRetry = quote(cat("Will try incrementing...\n")))
```

```
print.control.list    Pretty print the control list
```

Description

This function prints the control list, including what it can control and the elements.

Usage

```
## S3 method for class 'control.list'
print(x, ..., indent = "")
```

Arguments

x	A list generated by a control.* function.
...	Additional argument to print methods for individual settings.
indent	an argument for recursive calls, to facilitate indentation of nested lists.

See Also

[check.control.class](#), [set.control.class](#)

set.control.class *Set the class of the control list*

Description

This function sets the class of the control list, with the default being the name of the calling function.

Usage

```
set.control.class(  
  myname = as.character(ult(sys.calls(), 2)[[1L]]),  
  control = get("control", pos = parent.frame())  
)
```

Arguments

myname	Name of the class to set.
control	Control list. Defaults to the control variable in the calling function.

Value

The control list with class set.

Note

In earlier versions, OKnames and myname were autodetected. This capability has been deprecated and results in a warning issued once per session. They now need to be set explicitly.

See Also

[check.control.class\(\)](#), [print.control.list\(\)](#)

simplify_simple	<i>Convert a list to an atomic vector if it consists solely of atomic elements of length 1.</i>
-----------------	---

Description

This behaviour is not dissimilar to that of `simplify2array()`, but it offers more robust handling of empty or NULL elements and never promotes to a matrix or an array, making it suitable to be a column of a `data.frame`.

Usage

```
simplify_simple(
  x,
  toNA = c("null", "empty", "keep"),
  empty = c("keep", "unlist"),
  ...
)
```

Arguments

<code>x</code>	an R <code>list</code> to be simplified.
<code>toNA</code>	a character string indicating whether NULL entries (if "null") or 0-length entries including NULL (if "empty") should be replaced with NAs before attempting conversion; specifying keep or FALSE leaves them alone (typically preventing conversion).
<code>empty</code>	a character string indicating how empty lists should be handled: either "keep", in which case they are unchanged or "unlist", in which cases they are unlisted (typically to NULL).
<code>...</code>	additional arguments passed to <code>unlist()</code> .

Value

an atomic vector or a list of the same length as `x`.

Examples

```
(x <- as.list(1:5))
stopifnot(identical(simplify_simple(x), 1:5))

x[3] <- list(NULL) # Put a NULL in place of 3.
x
stopifnot(identical(simplify_simple(x, FALSE), x)) # Can't be simplified without replacing the NULL.

stopifnot(identical(simplify_simple(x), c(1L,2L,NA,4L,5L))) # NULL replaced by NA and simplified.

x[[3]] <- integer(0)
```

```
x
stopifnot(identical(simplify_simple(x), x)) # A 0-length vector is not replaced by default,
stopifnot(identical(simplify_simple(x, "empty"), c(1L,2L,NA,4L,5L))) # but can be.

(x <- lapply(1:5, function(i) c(i,i+1L))) # Elements are vectors of equal length.
simplify2array(x) # simplify2array() creates a matrix,
stopifnot(identical(simplify_simple(x), x)) # but simplify_simple() returns a list.
```

 snctrl

Statnet Control

Description

A utility to facilitate argument completion of control lists.

Usage

```
snctrl(...)
```

Arguments

... The parameter list is updated dynamically as packages are loaded and unloaded. Their current list is given below.

Details

In and of itself, `snctrl` copies its named arguments into a list. However, its argument list is updated dynamically as packages are loaded, as are those of its reexports from other packages. This is done using an API provided by helper functions. (See `API?snctrl`.)

Currently recognised control parameters

This list is updated as packages are loaded and unloaded.

Note

You may see messages along the lines of

```
The following object is masked from 'package:PKG':
snctrl
```

when loading packages. They are benign.

snctrl_names	<i>Helper functions used by packages to facilitate <code>snctrl</code> updating.</i>
--------------	--

Description

Helper functions used by packages to facilitate `snctrl` updating.

Usage

```
snctrl_names()

update_snctrl(myname, arglists = NULL, callback = NULL)

collate_controls(x = NULL, ...)

UPDATE_MY_SCTRL_EXPR

COLLATE_ALL_MY_CONTROLS_EXPR
```

Arguments

myname	Name of the package defining the arguments.
arglists	A named list of argument name-default pairs. If the list is not named, it is first passed through <code>collate_controls()</code> .
callback	A function with no arguments that updates the packages own copy of <code>snctrl()</code> .
x	Either a function, a list of functions, or an environment. If x is an environment, all functions starting with <code>dQuote(control.)</code> are obtained.
...	Additional functions or lists of functions.

Format

`UPDATE_MY_SCTRL_EXPR` is a quoted expression meant to be passed directly to `eval()`.
`COLLATE_ALL_MY_CONTROLS_EXPR` is a quoted expression meant to be passed directly to `eval()`.

Value

`update_snctrl()` has no return value and is used for its side-effects.
`collate_controls()` returns the combined list of name-default pairs of each function.

Functions

- `snctrl_names()`: Typeset the currently defined list of argument names by package and control function.
- `update_snctrl()`: Typically called from `.onLoad()`, Update the argument list of `snctrl()` to include additional argument names associated with the package, and set a callback for the package to update its own copy.

- `collate_controls()`: Obtain and concatenate the argument lists of specified functions or all functions starting with `dQuote(control.)` in the environment.
- `UPDATE_MY_SCTRL_EXPR`: A stored expression that, if evaluated, will create a callback function `update_my_snctrl()` that will update the client package's copy of `snctrl()`.
- `COLLATE_ALL_MY_CONTROLS_EXPR`: A stored expression that, if evaluated on loading, will add arguments of the package's `control.*()` functions to `snctrl()` and set the callback.

Examples

```
## Not run:
# In the client package (outside any function):
eval(UPDATE_MY_SCTRL_EXPR)

## End(Not run)
## Not run:
# In the client package:
.onLoad <- function(libname, pkgname){
  # ... other code ...
  eval(statnet.common::COLLATE_ALL_MY_CONTROLS_EXPR)
  # ... other code ...
}

## End(Not run)
```

split.array

A `split()` method for `array` and `matrix` types on a margin.

Description

These methods split an `array` and `matrix` into a list of arrays or matrices with the same number of dimensions according to the specified margin.

Usage

```
## S3 method for class 'array'
split(x, f, drop = FALSE, margin = NULL, ...)

## S3 method for class 'matrix'
split(x, f, drop = FALSE, margin = NULL, ...)
```

Arguments

<code>x</code>	A <code>matrix</code> or an <code>array</code> .
<code>f, drop</code>	See help for <code>split()</code> . Note that <code>drop</code> here is <i>not</i> for array dimensions: these are always preserved.
<code>margin</code>	Which margin of the array to split along. <code>NULL</code> splits as <code>split.default</code> , dropping dimensions.
<code>...</code>	Additional arguments to <code>split()</code> .

Examples

```
x <- diag(5)
f <- rep(1:2, c(2,3))
split(x, f, margin=1) # Split rows.
split(x, f, margin=2) # Split columns.

# This is similar to how data frames are split:
stopifnot(identical(split(x, f, margin=1),
  lapply(lapply(split(as.data.frame(x), f), as.matrix), unname)))
```

ssolve	<i>Wrappers around matrix algebra functions that pre-scale their arguments</i>
--------	--

Description

Covariance matrices of variables with very different orders of magnitude can have very large ratios between their greatest and their least eigenvalues, causing them to appear to the algorithms to be near-singular when they are actually very much SPD. These functions first scale the matrix's rows and/or columns by its diagonal elements and then undo the scaling on the result.

Usage

```
ssolve(a, b, ..., snnd = TRUE)

sginv(X, ..., snnd = TRUE)

srcond(x, ..., snnd = TRUE)

snearPD(x, ...)

xTAx_ssolve(x, A, ...)

xTAx_qrssolve(x, A, tol = 1e-07, ...)

sandwich_ssolve(A, B, ...)
```

Arguments

snnd assume that the matrix is symmetric non-negative definite (SNND). If it's "obvious" that it's not (e.g., negative diagonal elements), an error is raised.

x, a, b, X, A, B, tol, ... corresponding arguments of the wrapped functions.

Details

ssolve(), sginv(), and snearPD() wrap solve(), MASS::ginv(), and Matrix::nearPD(), respectively. srcond() returns the reciprocal condition number of rcond() net of the above scaling. xTAX_ssolve, xTAX_qrssolve, and sandwich_ssolve wrap the corresponding **statnet.common** functions.

Examples

```
x <- rnorm(2, sd=c(1,1e12))
x <- c(x, sum(x))
A <- matrix(c(1, 0, 1,
             0, 1e24, 1e24,
             1, 1e24, 1e24), 3, 3)
stopifnot(all.equal(
  xTAX_qrssolve(x,A),
  structure(drop(x%%sginv(A)%*%x), rank = 2L, nullity = 1L)
))

x <- rnorm(2, sd=c(1,1e12))
x <- c(x, rnorm(1, sd=1e12))
A <- matrix(c(1, 0, 1,
             0, 1e24, 1e24,
             1, 1e24, 1e24), 3, 3)

stopifnot(try(xTAX_qrssolve(x,A), silent=TRUE) ==
  "Error in xTAX_qrssolve(x, A) : x is not in the span of A\n")
```

statnet.cite

CITATION *file utilities for Statnet packages (DEPRECATED)*

Description

These functions automate citation generation for Statnet Project packages. They no longer appear to work with CRAN and are thus deprecated.

Usage

```
statnet.cite.head(pkg)
```

```
statnet.cite.foot(pkg)
```

```
statnet.cite.pkg(pkg)
```

Arguments

pkg Name of the package whose citation is being generated.

Value

For `statnet.cite.head` and `statnet.cite.footer`, an object of type `citationHeader` and `citationFooter`, respectively, understood by the `citation` function, with package name substituted into the template.

For `statnet.cite.pkg`, an object of class `bibentry` containing a 'software manual' citation for the package constructed from the current version and author information in the `DESCRIPTION` and a template.

See Also

`citation`, `citHeader`, `citFooter`, `bibentry`

Examples

```
## Not run:
statnet.cite.head("statnet.common")

statnet.cite.pkg("statnet.common")

statnet.cite.footer("statnet.common")

## End(Not run)
```

`statnetStartupMessage` *Construct a "standard" startup message to be printed when the package is loaded.*

Description

This function uses information returned by `packageDescription()` to construct a standard package startup message according to the policy of the Statnet Project.

Usage

```
statnetStartupMessage(pkgname, friends = c(), nofriends = c())
```

Arguments

`pkgname` Name of the package whose information is used.
`friends, nofriends`
 No longer used.

Value

A string containing the startup message, to be passed to the `packageStartupMessage()` call or `NULL`, if policy prescribes printing default startup message. (Thus, if `statnetStartupMessage()` returns `NULL`, the calling package should not call `packageStartupMessage()` at all.)

Note

Earlier versions of this function printed a more expansive message. This may change again as the Statnet Project policy evolves.

See Also

[packageDescription\(\)](#), [packageStartupMessage\(\)](#)

Examples

```
## Not run:
.onAttach <- function(lib, pkg){
  sm <- statnetStartupMessage("ergm")
  if(!is.null(sm)) packageStartupMessage(sm)
}

## End(Not run)
```

sweep_cols.matrix	<i>Subtract a elements of a vector from respective columns of a matrix</i>
-------------------	--

Description

An optimized function equivalent to `sweep(x, 2, STATS)` for a matrix `x`.

Usage

```
sweep_cols.matrix(x, STATS, disable_checks = FALSE)
```

Arguments

`x` a numeric matrix;

`STATS` a numeric vector whose length equals to the number of columns of `x`.

`disable_checks` if TRUE, do not check that `x` is a numeric matrix and its number of columns matches the length of `STATS`; set in production code for a significant speed-up.

Value

A matrix of the same attributes as `x`.

Examples

```
x <- matrix(runif(1000), ncol=4)
s <- 1:4

stopifnot(all.equal(sweep_cols.matrix(x, s), sweep(x, 2, s)))
```

`term_list`*A helper class for list of terms in an formula*

Description

Typically generated by `list_rhs.formula()`, it contains, in addition to a list of `call()` or similar objects, attributes "sign" and "env", containing, respectively a vector of signs that the terms had in the original formula and a list of environments of the formula from which the term has been extracted. Indexing and concatenation methods preserve these.

Usage

```
term_list(x, sign = +1, env = NULL)

as.term_list(x, ...)

## S3 method for class 'term_list'
as.term_list(x, ...)

## Default S3 method:
as.term_list(x, sign = +1, env = NULL, ...)

## S3 method for class 'term_list'
c(x, ...)

## S3 method for class 'term_list'
x[i, ...]

## S3 method for class 'term_list'
print(x, ...)
```

Arguments

<code>x</code>	a list of terms or a term; a <code>term_list</code>
<code>sign</code>	a vector specifying the signs associated with each term (-1 and +1)
<code>env</code>	a list specifying the environments, or <code>NULL</code>
<code>...</code>	additional arguments to methods
<code>i</code>	list index

See Also

[list_rhs.formula\(\)](#), [list_summands.call\(\)](#)

Examples

```
e1 <- new.env()
f1 <- a~b+c
environment(f1) <- e1
f2 <- ~-NULL+1

(l1 <- list_rhs.formula(f1))
(l2 <- list_rhs.formula(f2))

(l <- c(l1,l2))

(l <- c(l2[1], l1[2], l1[1], l1[1], l2[2]))
```

trim_env

Make a copy of an environment with just the selected objects.

Description

Make a copy of an environment with just the selected objects.

Usage

```
trim_env(object, keep = NULL, ...)

## S3 method for class 'environment'
trim_env(object, keep = NULL, ...)

## Default S3 method:
trim_env(object, keep = NULL, ...)
```

Arguments

object	An environment or an object with environment() and environment()<- methods.
keep	A character vector giving names of variables in the environment (including its ancestors) to copy over, defaulting to dropping all. Variables that cannot be resolved are silently ignored.
...	Additional arguments, passed on to lower-level methods.

Value

An object of the same type as object, with updated environment.

Methods (by class)

- `trim_env(environment)`: A method for environment objects.
- `trim_env(default)`: Default method, for objects such as `formula` and `function` that have `environment()` and `environment()<-` methods.

<code>ult</code>	<i>Extract or replace the ultimate (last) element of a vector or a list, or an element counting from the end.</i>
------------------	---

Description

Extract or replace the *ultimate* (last) element of a vector or a list, or an element counting from the end.

Usage

```
ult(x, i = 1L)
```

```
ult(x, i = 1L) <- value
```

Arguments

<code>x</code>	a vector or a list.
<code>i</code>	index from the end of the list to extract or replace (where 1 is the last element, 2 is the penultimate element, etc.).
<code>value</code>	Replacement value for the <code>i</code> th element from the end.

Value

An element of `x`.

Note

Due to the way in which assigning to a function is implemented in R, `ult(x) <- e` may be less efficient than `x[[length(x)]] <- e`.

Examples

```
x <- 1:5
(last <- ult(x))
(penultimate <- ult(x, 2)) # 2nd last.
```

```
(ult(x) <- 6)
(ult(x, 2) <- 7) # 2nd last.
x
```

unused_dots_warning *An error handler for `rlang::check_dots_used()` that issues a warning that only lists argument names.*

Description

This handler parses the error message produced by `rlang::check_dots_used()`, extracting the names of the unused arguments, and formats them into a more gentle warning message. It relies on **rlang** maintaining its current format.

Usage

```
unused_dots_warning(e)
```

Arguments

`e` a [condition](#) object, typically not passed by the end-user; see example below.

Examples

```
g <- function(b=NULL, ...){
  invisible(force(b))
}

f <- function(...){
  rlang::check_dots_used(error = unused_dots_warning)
  g(...)
}

f() # OK
f(b=2) # OK
f(a=1, b=2, c=3) # Warning about a and c but not about b
```

unwhich	<i>Construct a logical vector with TRUE in specified positions.</i>
---------	---

Description

This function is basically an inverse of [which](#).

Usage

```
unwhich(which, n)
```

Arguments

which	a numeric vector of indices to set to TRUE.
n	total length of the output vector.

Value

A logical vector of length n whose elements listed in which are set to TRUE, and whose other elements are set to FALSE.

Examples

```
x <- as.logical(rbinom(10,1,0.5))
stopifnot(all(x == unwhich(which(x), 10)))
```

vector.namesmatch	<i>reorder vector v into order determined by matching the names of its elements to a vector of names</i>
-------------------	--

Description

A helper function to reorder vector v (if named) into order specified by matching its names to the argument names

Usage

```
vector.namesmatch(v, names, errname = NULL)
```

Arguments

v	a vector (or list) with named elements, to be reordered
names	a character vector of element names, corresponding to names of v, specifying desired ordering of v
errname	optional, name to be reported in any error messages. default to <code>deparse(substitute(v))</code>

Details

does some checking of appropriateness of arguments, and reorders `v` by matching its names to character vector names

Value

returns `v`, with elements reordered

Note

earlier versions of this function did not order as advertised

Examples

```
test<-list(c=1,b=2,a=3)
vector.namesmatch(test,names=c('a','c','b'))
```

Welford

A Welford accumulator for sample mean and variance

Description

A simple class for keeping track of the running mean and the sum of squared deviations from the mean for a vector.

Usage

```
Welford(dn, means, vars)
```

```
## S3 method for class 'Welford'
update(object, newdata, ...)
```

Arguments

<code>dn, means, vars</code>	initialization of the Welford object: if <code>means</code> and <code>vars</code> are given, they are treated as the running means and variances, and <code>dn</code> is their associated sample size, and if not, <code>dn</code> is the dimension of the vector (with sample size 0).
<code>object</code>	a Welford object.
<code>newdata</code>	either a numeric vector of length <code>d</code> , a numeric matrix with <code>d</code> columns for a group update, or another Welford object with the same <code>d</code> .
<code>...</code>	additional arguments to methods.

Value

an object of type `Welford`: a list with four elements:

1. `n`: Running number of observations
2. `means`: Running mean for each variable
3. `SSDs`: Running sum of squared deviations from the mean for each variable
4. `vars`: Running variance of each variable

Methods (by generic)

- `update(Welford)`: Update a `Welford` object with new data.

Examples

```
X <- matrix(rnorm(200), 20, 10)
w0 <- Welford(10)

w <- update(w0, X)
stopifnot(isTRUE(all.equal(w$means, colMeans(X))))
stopifnot(isTRUE(all.equal(w$vars, apply(X,2,var))))

w <- update(w0, X[1:12,])
w <- update(w, X[13:20,])
stopifnot(isTRUE(all.equal(w$means, colMeans(X))))
stopifnot(isTRUE(all.equal(w$vars, apply(X,2,var))))

w <- Welford(12, colMeans(X[1:12,]), apply(X[1:12,], 2, var))
w <- update(w, X[13:20,])
stopifnot(isTRUE(all.equal(w$means, colMeans(X))))
stopifnot(isTRUE(all.equal(w$vars, apply(X,2,var))))
```

wmatrix

A data matrix with row weights

Description

A representation of a numeric matrix with row weights, represented on either linear (`linwmatrix`) or logarithmic (`logwmatrix`) scale.

Usage

```
logwmatrix(
  data = NA,
  nrow = 1,
  ncol = 1,
  byrow = FALSE,
  dimnames = NULL,
```

```
w = NULL
)

linwmatrix(
  data = NA,
  nrow = 1,
  ncol = 1,
  byrow = FALSE,
  dimnames = NULL,
  w = NULL
)

is.wmatrix(x)

is.logwmatrix(x)

is.linwmatrix(x)

as.linwmatrix(x, ...)

as.logwmatrix(x, ...)

## S3 method for class 'linwmatrix'
as.linwmatrix(x, ...)

## S3 method for class 'logwmatrix'
as.linwmatrix(x, ...)

## S3 method for class 'logwmatrix'
as.logwmatrix(x, ...)

## S3 method for class 'linwmatrix'
as.logwmatrix(x, ...)

## S3 method for class 'matrix'
as.linwmatrix(x, w = NULL, ...)

## S3 method for class 'matrix'
as.logwmatrix(x, w = NULL, ...)

## S3 method for class 'wmatrix'
print(x, ...)

## S3 method for class 'logwmatrix'
print(x, ...)

## S3 method for class 'linwmatrix'
print(x, ...)
```

```
## S3 method for class 'logwmatrix'
compress_rows(x, ...)

## S3 method for class 'linwmatrix'
compress_rows(x, ...)

## S3 method for class 'wmatrix'
decompress_rows(x, target.nrows = NULL, ...)

## S3 method for class 'wmatrix'
x[i, j, ..., drop = FALSE]

## S3 replacement method for class 'wmatrix'
x[i, j, ...] <- value
```

Arguments

data, nrow, ncol, byrow, dimnames	passed to matrix .
w	row weights on the appropriate scale.
x	an object to be coerced or tested.
...	extra arguments, currently unused.
target.nrows	the approximate number of rows the uncompressed matrix should have; if not achievable exactly while respecting proportionality, a matrix with a slightly different number of rows will be constructed.
i, j, value	rows and columns and values for extraction or replacement; as matrix .
drop	Used for consistency with the generic. Ignored, and always treated as FALSE.

Value

An object of class `linwmatrix/logwmatrix` and `wmatrix`, which is a [matrix](#) but also has an attribute `w` containing row weights on the linear or the natural-log-transformed scale.

Note

Note that `wmatrix` itself is an "abstract" class: you cannot instantiate it.

Note that at this time, `wmatrix` is designed as, first and foremost, as class for storing compressed data matrices, so most methods that operate on matrices may not handle the weights correctly and may even cause them to be lost.

See Also

[rowweights](#), [lrowweights](#), [compress_rows](#)

Examples

```

(m <- matrix(1:3, 2, 3, byrow=TRUE))
(m <- rbind(m, 3*m, 2*m, m))
(mlog <- as.logwmatrix(m))
(mlin <- as.linwmatrix(m))
(cmlog <- compress_rows(mlog))
(cmlin <- compress_rows(mlin))

stopifnot(all.equal(as.linwmatrix(cmlog),cmlin))

cmlog[2,] <- 1:3
(cmlog <- compress_rows(cmlog))
stopifnot(sum(rowweights(cmlog))==nrow(m))

(m3 <- matrix(c(1:3,(1:3)*2,(1:3)*3), 3, 3, byrow=TRUE))
(rowweights(m3) <- c(4, 2, 2))

stopifnot(all.equal(compress_rows(as.logwmatrix(m)), as.logwmatrix(m3),check.attributes=FALSE))
stopifnot(all.equal(rowweights(compress_rows(as.logwmatrix(m))),
                    rowweights(as.logwmatrix(m3)),check.attributes=FALSE))

```

wmatrix_weights

Set or extract weighted matrix row weights

Description

Set or extract weighted matrix row weights

Usage

```

rowweights(x, ...)

## S3 method for class 'linwmatrix'
rowweights(x, ...)

## S3 method for class 'logwmatrix'
rowweights(x, ...)

lrowweights(x, ...)

## S3 method for class 'logwmatrix'
lrowweights(x, ...)

## S3 method for class 'linwmatrix'
lrowweights(x, ...)

rowweights(x, ...) <- value

```

```

## S3 replacement method for class 'linwmatrix'
rowweights(x, update = TRUE, ...) <- value

## S3 replacement method for class 'logwmatrix'
rowweights(x, update = TRUE, ...) <- value

lrowweights(x, ...) <- value

## S3 replacement method for class 'linwmatrix'
lrowweights(x, update = TRUE, ...) <- value

## S3 replacement method for class 'logwmatrix'
lrowweights(x, update = TRUE, ...) <- value

## S3 replacement method for class 'matrix'
rowweights(x, ...) <- value

## S3 replacement method for class 'matrix'
lrowweights(x, ...) <- value

```

Arguments

x	a <code>linwmatrix</code> , a <code>logwmatrix</code> , or a <code>matrix</code> ; a <code>matrix</code> is coerced to a weighted matrix of an appropriate type.
...	extra arguments for methods.
value	weights to set, on the appropriate scale.
update	if TRUE (the default), the old weights are updated with the new weights (i.e., corresponding weights are multiplied on linear scale or added on on log scale); otherwise, they are overwritten.

Value

For the accessor functions, the row weights or the row log-weights; otherwise, a weighted matrix with modified weights. The type of weight (linear or logarithmic) is converted to the required type and the type of weighting of the matrix is preserved.

xTAX

Common quadratic forms

Description

Common quadratic forms

Usage

```

xTAX(x, A)

xAXT(x, A)

xTAX_solve(x, A, ...)

xTAX_qrsolve(x, A, tol = 1e-07, ...)

sandwich_solve(A, B, ...)

```

Arguments

x	a vector
A	a square matrix
...	additional arguments to subroutines
tol	tolerance argument passed to the relevant subroutine
B	a square matrix

Details

These are somewhat inspired by `emulator::quad.form.inv()` and others.

Functions

- `xTAX()`: Evaluate $x'Ax$ for vector x and square matrix A .
- `xAXT()`: Evaluate xAx' for vector x and square matrix A .
- `xTAX_solve()`: Evaluate $x'A^{-1}x$ for vector x and invertible matrix A using `solve()`.
- `xTAX_qrsolve()`: Evaluate $x'A^{-1}x$ for vector x and matrix A using QR decomposition and confirming that x is in the span of A if A is singular; returns `rank` and `nullity` as attributes just in case subsequent calculations (e.g., hypothesis test degrees of freedom) are affected.
- `sandwich_solve()`: Evaluate $A^{-1}B(A')^{-1}$ for B a square matrix and A invertible.
