6.17.23 The concept of continuously differentiable

John Harrison writes as follows:

“The usual assumption in complex analysis texts is that a path γ should be piecewise continuously differentiable, which ensures that the path integral exists at least for any continuous f , since all piecewise continuous functions are integrable. However, our notion of validity is weaker, just piecewise differentiability. . . [namely] continuity plus differentiability except on a finite set. . . [Our] underlying theory of integration is the Kurzweil-Henstock theory. In contrast to the Riemann or Lebesgue theory (but in common with a simple notion based on antiderivatives), this can integrate all derivatives.”

"Formalizing basic complex analysis." From Insight to Proof: Festschrift in Honour of Andrzej Trybulec. Studies in Logic, Grammar and Rhetoric 10.23

(2007): 151-165.

And indeed he does not assume that his derivatives are continuous, but the penalty is unreasonably difficult proofs concerning winding numbers. We need a self-contained and straightforward theorem asserting that all derivatives can be integrated before we can adopt Harrison's choice.

This function returns the angle of a complex number from its representation in polar coordinates. Due to periodicity, its range is arbitrary. *Arg2pi* follows HOL Light in adopting the interval $[0, 2\pi)$. But we have the same periodicity issue with logarithms, and it is usual to adopt the same interval for the complex logarithm and argument functions. Further on down, we shall define

1960

both functions for the interval $(-\pi, \pi]$. The present version is provided for compatibility.

7.1 Sigma Algebra

Sigma algebras are an elementary concept in measure theory. To measure — that is to integrate — functions, we first have to measure sets. Unfortunately, when dealing with a large universe, it is often not possible to consistently assign a measure to every subset. Therefore it is necessary to define the set of measurable subsets of the universe. A sigma algebra is such a set that has three very natural and desirable properties.

7.1.1 Families of sets

```

7.7.3 Measurability

There are two natural sigma-algebras on a product space: the borel sigma algebra, generated by open sets in the product, and the product sigma algebra, countably generated by products of measurable sets along finitely many coordinates. The second one is defined and studied in `Finite_Product_Measure.thy`.

These sigma-algebras share a lot of natural properties (measurability of coordinates, for instance), but there is a fundamental difference: open sets are generated by arbitrary unions, not only countable ones, so typically many open sets will not be measurable with respect to the product sigma algebra (while all sets in the product sigma algebra are borel). The two sigma algebras coincide only when everything is countable (i.e., the product is countable, and the borel sigma algebra in the factor is countably generated).

In this paragraph, we develop basic measurability properties for the borel sigma algebra, and compare it with the product sigma algebra as explained above.

```

unfolding *comp_def* **by** *auto*
then show *?thesis* **by** *simp*
qed

To compare the Borel sigma algebra with the product sigma algebra, we give a presentation of the product sigma algebra that is more similar to the one we used above for the product topology.

Covering lemma

Some technical lemmas used in the approximation results that follow. Proof of the covering lemma is an obvious multidimensional generalization of Lemma 3, p65 of Swartz's "Introduction to Gauge Integrals".

proposition *covering_lemma*:

assumes $S \subseteq \text{cbox } a \ b \ \text{box } a \ b \neq \{\}$ *gauge* g

obtains \mathcal{D} **where**

countable $\mathcal{D} \cup \mathcal{D} \subseteq \text{cbox } a \ b$

$\bigwedge K. K \in \mathcal{D} \implies \text{interior } K \neq \{\} \wedge (\exists c \ d. K = \text{cbox } c \ d)$

pairwise $(\lambda A \ B. \text{interior } A \cap \text{interior } B = \{\}) \ \mathcal{D}$

$\bigwedge K. K \in \mathcal{D} \implies \exists x \in S \cap K. K \subseteq g \ x$

$\bigwedge u \ v. \text{cbox } u \ v \in \mathcal{D} \implies \exists n. \forall i \in \text{Basis}. v \cdot i - u \cdot i = (b \cdot i - a \cdot i) / 2^{\wedge} n$
 $S \subseteq \bigcup \mathcal{D}$

proof –

have *aibi*: $\bigwedge i. i \in \text{Basis} \implies a \cdot i \leq b \cdot i$ **and** *normab*: $0 < \text{norm}(b - a)$

using $\langle \text{box } a \ b \neq \{\} \rangle$ *box_eq_empty* *box_idem* **by** *fastforce*+

let $?K0 = \lambda(n, f::'a \Rightarrow \text{nat}).$

$\text{cbox } (\sum i \in \text{Basis}. (a \cdot i + (f \ i / 2^{\wedge} n) * (b \cdot i - a \cdot i)) *_{\mathbb{R}} i)$

$(\sum i \in \text{Basis}. (a \cdot i + ((f \ i + 1) / 2^{\wedge} n) * (b \cdot i - a \cdot i)) *_{\mathbb{R}} i)$

let $?D0 = ?K0 \ ' (SIGMA \ n:UNIV. Pi_E \ \text{Basis} \ (\lambda i::'a. \text{lessThan } (2^{\wedge} n)))$

obtain $\mathcal{D}0$ **where** *count*: *countable* $\mathcal{D}0$

and *sub*: $\bigcup \mathcal{D}0 \subseteq \text{cbox } a \ b$

and *int*: $\bigwedge K. K \in \mathcal{D}0 \implies (\text{interior } K \neq \{\}) \wedge (\exists c \ d. K = \text{cbox } c \ d)$

and *intdj*: $\bigwedge A \ B. \llbracket A \in \mathcal{D}0; B \in \mathcal{D}0 \rrbracket \implies A \subseteq B \vee B \subseteq A \vee \text{interior}$

$A \cap \text{interior } B = \{\}$

and *SK*: $\bigwedge x. x \in S \implies \exists K \in \mathcal{D}0. x \in K \wedge K \subseteq g \ x$

and *cbox*: $\bigwedge u \ v. \text{cbox } u \ v \in \mathcal{D}0 \implies \exists n. \forall i \in \text{Basis}. v \cdot i - u \cdot i = (b \cdot i - a \cdot i) / 2^{\wedge} n$

and *fin*: $\bigwedge K. K \in \mathcal{D}0 \implies \text{finite } \{L \in \mathcal{D}0. K \subseteq L\}$

```

No formalisation of Liouville's Approximation Theorem because this is already in the AFP as Liouville_Numbers. Apostol's Theorem 7.5 should be exactly the theorem liouville_irrational_algebraic. There is a minor discrepancy in the definition of "Liouville number" between Apostol and Eberl: he requires the denominator to be positive, while Eberl require it to exceed 1.

8.2 Kronecker's Approximation Theorem: the One-dimensional Case

```
