6.4 Homotopy of Maps

```

theory Homotopy
  imports Path_Connected Product_Topology Uncountable_Sets
begin

```

```

definition homotopic_with

```

```

where

```

```

homotopic_with P X Y f g ≡
  ( $\exists h. \text{continuous\_map } (\text{prod\_topology } (\text{top\_of\_set } \{0..1::\text{real}\}) X) Y h \wedge$ 
   ( $\forall x. h(0, x) = f x$ )  $\wedge$ 

```

$$(\forall x. h(1, x) = g x) \wedge \\ (\forall t \in \{0..1\}. P(\lambda x. h(t, x)))$$

p, q are functions $X \rightarrow Y$, and the property P restricts all intermediate maps. We often just want to require that P fixes some subset, but to include the case of a loop homotopy, it is convenient to have a general property P .

abbreviation *homotopic_with_canon* ::

$$[('a :: \text{topological_space} \Rightarrow 'b :: \text{topological_space}) \Rightarrow \text{bool}, 'a \text{ set}, 'b \text{ set}, 'a \Rightarrow 'b, 'a \Rightarrow 'b] \Rightarrow \text{bool}$$

where

$$\text{homotopic_with_canon } P \ S \ T \ p \ q \equiv \text{homotopic_with } P \ (\text{top_of_set } S) \ (\text{top_of_set } T) \ p \ q$$

6.4.24 Contractible spaces

The definition (which agrees with "contractible" on subsets of Euclidean space) is a little cryptic because we don't in fact assume that the constant "a" is in the space. This forces the convention that the empty space / set is contractible, avoiding some special cases.

definition *contractible_space where*

```
contractible_space X ≡ ∃ a. homotopic_with (λx. True) X X id (λx. a)
```

6.4.28 Nullhomotopic mappings

A mapping out of a sphere is nullhomotopic iff it extends to the ball. This even works out in the degenerate cases when the radius is ≤ 0 , and we also don't need to explicitly assume continuity since it's already implicit in both sides of the equivalence.

lemma *nullhomotopic_from_lemma*:

```

assumes contg: continuous_on (cball a r - {a}) g
  and fa:  $\bigwedge e. 0 < e$ 
            $\implies \exists d. 0 < d \wedge (\forall x. x \neq a \wedge \text{norm}(x - a) < d \implies \text{norm}(g x - f$ 
a) < e)
```

and $r: \bigwedge x. x \in \text{cball } a \ r \wedge x \neq a \implies f x = g x$

shows *continuous_on* (cball a r) f

proof (clarsimp simp: continuous_on_eq_continuous_within Ball_def)

6.8 Infinite sums

In this theory, we introduce the definition of infinite sums, i.e., sums ranging over an infinite, potentially uncountable index set with no particular ordering. (This is different from series. Those are sums indexed by natural numbers, and the order of the index set matters.)

Our definition is quite standard: $s := \sum_{x \in A} f(x)$ is the limit of finite sums $s_F := \sum_{x \in F} f(x)$ for increasing F . That is, s is the limit of the net s_F where F are finite subsets of A ordered by inclusion. We believe that this is the standard definition for such sums. See, e.g., Definition 4.11 in [2]. This definition is quite general: it is well-defined whenever f takes values in some commutative monoid endowed with a Hausdorff topology. (Examples are reals, complex numbers, normed vector spaces, and more.)

The converse of *abs_summable_summable* does not hold: Consider the Hilbert space of square-summable sequences. Let e_i denote the sequence with 1 in the i th position and 0 elsewhere. Let $f(i) := e_i/i$ for $i \geq 1$. We have $\neg f \text{ abs_summable_on } UNIV$ because $\|f(i)\| = 1/i$ and thus the sum over $\|f(i)\|$ diverges. On the other hand, we have $f \text{ summable_on } UNIV$; the limit is the sequence with $1/i$ in the i th position.

(We have not formalized this separating example here because to the best of our knowledge, this Hilbert space has not been formalized in Isabelle/HOL yet.)

The following lemma indeed needs a complete space (as formalized by the premise *complete UNIV*). The following two counterexamples show this:

- Consider the real vector space V of sequences with finite support, and with the ℓ_2 -norm (sum of squares). Let e_i denote the sequence with a 1 at position i . Let $f : \mathbb{Z} \rightarrow V$ be defined as $f(n) := e_{|n|}/n$ (with $f(0) := 0$). We have that $\sum_{n \in \mathbb{Z}} f(n) = 0$ (it even converges absolutely). But $\sum_{n \in \mathbb{N}} f(n)$ does not exist (it would converge against a sequence with infinite support).
- Let f be a positive rational valued function such that $\sum_{x \in B} f(x)$ is $\sqrt{2}$ and $\sum_{x \in A} f(x)$ is 1 (over the reals, with $A \subseteq B$). Then $\sum_{x \in B} f(x)$ does not exist over the rationals. But $\sum_{x \in A} f(x)$ exists.

The lemma also requires uniform continuity of the addition. And example of a topological group with continuous but not uniformly continuous addition would be the positive reals with the usual multiplication as the addition.

We do not know whether the lemma would also hold for such topological groups.

```

The lemmas *infsum_comm_additive_general* and *infsum_comm_additive* (and variants) below both state that the infinite sum commutes with a continuous additive function. *infsum_comm_additive_general* is stated more for more general type classes at the expense of a somewhat less compact formulation of the premises. E.g., by avoiding the constant *additive* which introduces an additional sort constraint (group instead of monoid). For example, extended reals (*ereal*, *ennreal*) are not covered by *infsum_comm_additive*.

lemma *has_sum_comm_additive_general*:

```

fixes  $f :: \langle 'b :: \{ \text{comm\_monoid\_add}, \text{topological\_space} \} \Rightarrow 'c :: \{ \text{comm\_monoid\_add}, \text{topological\_space} \} \rangle$ 
assumes  $\text{f\_sum}: \langle \bigwedge F. \text{finite } F \implies F \subseteq S \implies \text{sum } (f \circ g) F = f (\text{sum } g F) \rangle$ 
  — Not using additive because it would add sort constraint ab_group_add
assumes  $\text{cont}: \langle f \text{ --}x \rightarrow f x \rangle$ 
  — For t2_space, this is equivalent to isCont f x by isCont_def.
assumes  $\text{infsum}: \langle (g \text{ has\_sum } x) S \rangle$ 
shows  $\langle ((f \circ g) \text{ has\_sum } (f x)) S \rangle$ 

```

proof —

```

6.11.20 Theorems from Kuratowski

Kuratowski, Remark on an Invariance Theorem, *Fundamenta Mathematicae* **37** (1950), pp. 251-252. The idea is that in suitable spaces, to show "number of components of the complement" (without distinguishing orders of infinity) is a homeomorphic invariant, it suffices to show it for closed subsets. Kuratowski states the main result for a "locally connected continuum", and seems clearly to be implicitly assuming that means metrizable. We call out the general topological hypotheses more explicitly, which do not however include connectedness.

Continuity of addition

The next few lemmas remove an unnecessary assumption in *tendsto_add_ereal*, culminating in *tendsto_add_ereal_general* which essentially says that the addition is continuous on *ereal* times *ereal*, except at $(-\infty, \infty)$ and $(\infty, -\infty)$. It is much more convenient in many situations, see for instance the proof of *tendsto_sum_ereal* below.

```

6.16.7 The strong operator topology on continuous linear operators

Let *'a* and *'b* be two normed real vector spaces. Then the space of linear continuous operators from *'a* to *'b* has a canonical norm, and therefore a canonical corresponding topology (the type classes instantiation are given in `Bounded_Linear_Function.thy`).

However, there is another topology on this space, the strong operator topology, where T_n tends to T iff, for all x in *'a*, then $T_n x$ tends to $T x$. This is precisely the product topology where the target space is endowed with the norm topology. It is especially useful when *'b* is the set of real numbers, since then this topology is compact.

We can not implement it using type classes as there is already a topology, but at least we can define it as a topology.

Note that there is yet another (common and useful) topology on operator spaces, the weak operator topology, defined analogously using the product topology, but where the target space is given the weak-* topology, i.e., the pullback of the weak topology on the bidual of the space under the canonical embedding of a space into its bidual. We do not define it there, although it could also be defined analogously.

```

Invertible derivative continuous at a point implies local injectivity. It's only for this we need continuity of the derivative, except of course if we want the fact that the inverse derivative is also continuous. So if we know for some other reason that the inverse function exists, it's OK.

```
